

ID: BUG001_APP1_SET

Type: Bug

Summary: Profile setting allow saving invalid Data

Severity: Major

Priority: Hight

Author: Dmytro

Date: 02.07.2026

Environment: Samsung A26 5G, Android 16, App: v1.1.5

Preconditions:

- The app is installed and open.
- The user has succesfully registered with valid Data ([text]@[domain].[tld] / Name / Password).
- The user is logged into the app.
- The user is on the main screen.
- The Setting section is open.
- The “Edit Pofile“ button has been pressed.

Steps to Reproduse:

1. Delete all characters in the "Name" field.
2. Remove the “@“ symbol from the “Email“ field.
3. Click the Save button.

Actual Result:

- The app saves invalid data without any validation errors.
- The “Name“ field is saved as empty.
- The “Email“ field is saved as “tester123321gmailcom“ (without “@“ and “.“).

Expected Result:

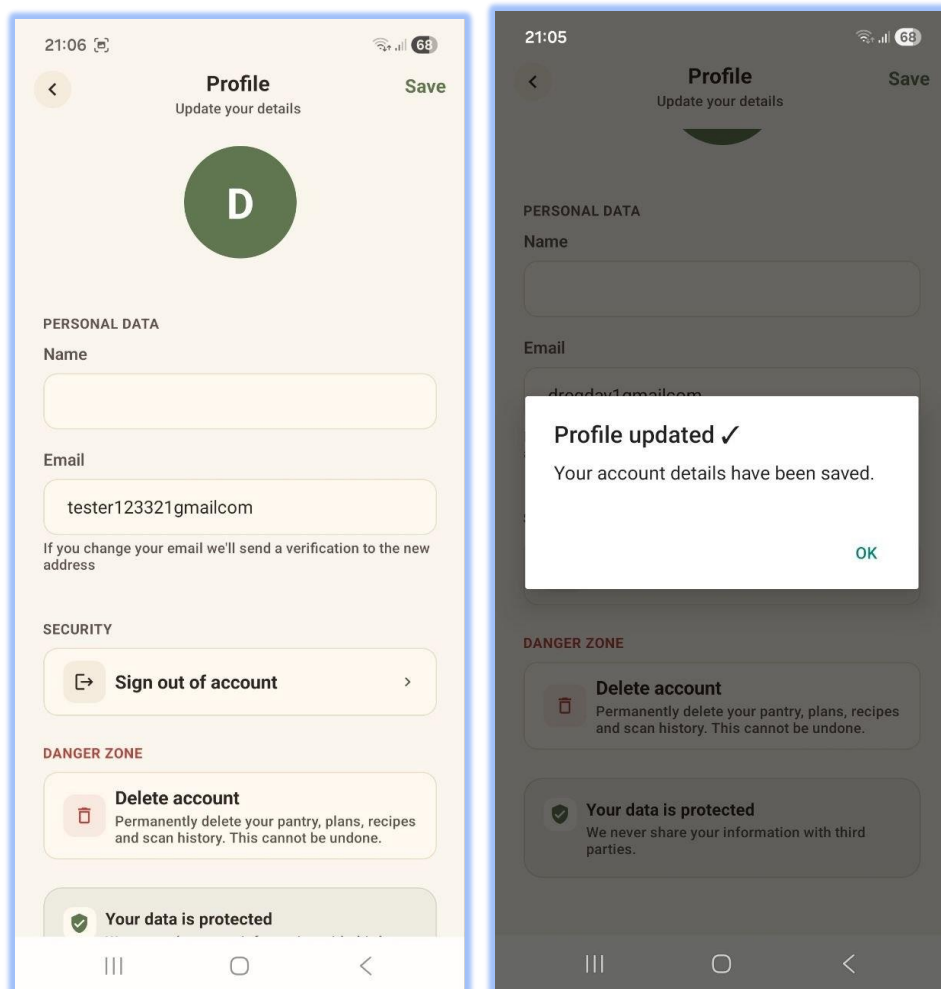

- The Email field must be validated against the mask: [text]@[domain].[tld].
- The "Name" field must either accept only letters (Cyrillic/Latin) or correctly escape special characters.

- When attempting to save invalid Data, an error should appear: "Please enter a valid email" or "The field cannot be empty."

Business Impact:

"This bug allows invalid email addresses to accumulate in the database. In the future, this will make password recovery impossible for such users and lead to errors in the notification system. If the application uses email to send receipts or order confirmations, this poses a direct risk of losing customers. I recommend implementing validation at both the frontend and backend levels."
